fps 24 seconds A: Well, I found the solution. It's not about using longer videos. The problem is that too many frames are missing so one frame is expected in the middle of a shot but it doesn't happen and that's why the frames aren't synchronized. If you want to use video editing software, you will lose some frames in the process. Edit the video frame by frame. This invention relates generally to continuous carbon melt electrolytic conversion cells, and more specifically to those of the so-called "cathode-side-down" type having a fluid flow relationship with a molten carbonaceous anode material formed by the thermal decomposition of a hydrocarbon fuel with a hydrogen-containing gas such as natural gas. The cathode-side-down cell is a useful and promising technique of converting hydrocarbon fuels to hydrogen-containing gases for the purpose of fuel cell applications in the future. Its principal advantages include its potential to be operated with inexpensive natural gas as the fuel gas, low capital cost of the cell design, and low maintenance cost. In the cathode-side-down type of cell, the fuel is decomposed at the positive electrode or cathode and an oxidant is formed at the negative electrode or anode. The oxidant moves from the anode to the cathode through a molten carbonaceous anode material formed by the thermal decomposition of the fuel. Carbonaceous materials suitable for use in a cathode-side-down cell are well known in the art. See, for example, U.S. Pat. No. 3,532,545. One of the more promising carbonaceous materials for use in a cathode-side-down cell is petroleum coke, which is a carbonaceous material of relatively high electrical conductivity and thermal stability. One problem which arises in the operation of the cathode-side-down cell is that the area of the anode is limited by the molten carbonaceous material which is formed by the thermal decomposition of the fuel. As this area is gradually reduced, the electrical resistance of the anode increases, thereby producing an imbalance of electrical charge across the cell. This imbalance causes the cell voltage to increase. It is therefore desirable to have some means for assuring that a relatively constant area of anode material is maintained. This invention addresses this problem by providing a series of vertically spaced-apart current feeders having electrical contact with a plurality of vertically spaced-ap
